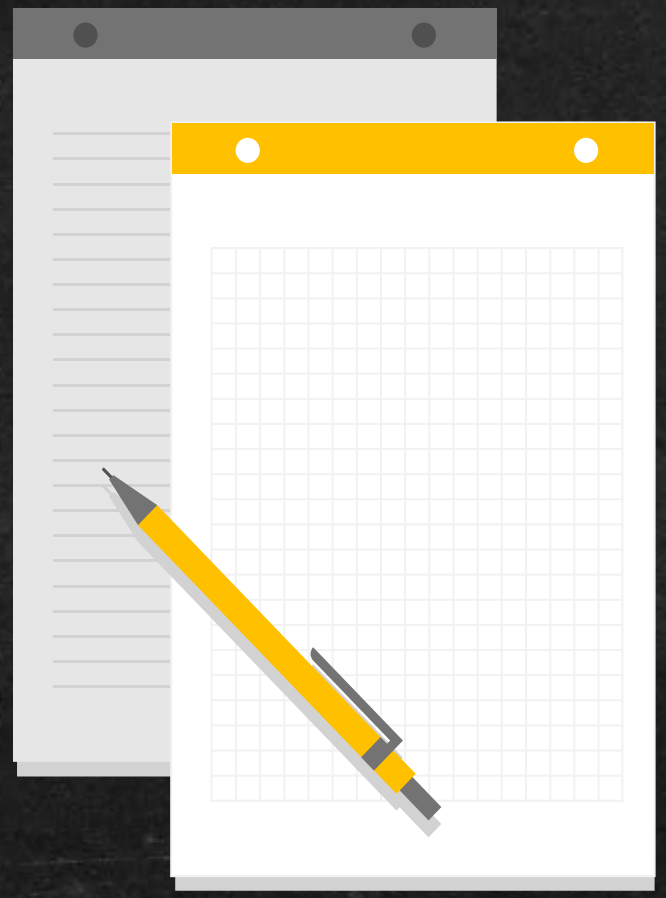
Books Sales & Ratings Analysis

Web Scraping + Data Cleaning & EDA using Python + Power BI + Sql

Name:- Vikas Prajapati

Problem Statement

- Analyze book dataset to understand pricing, ratings, and category trends .
- Identify patterns between price and rating.
- Find which categories perform best.



Dataset Overview

- Total Records: ~1000 books.

Columns:

- Title
- Category
- Price (€)
- Rating

Tools Used

- Python (Data Cleaning + Web Scraping).
- SQL (Insights).
- Power BI (Dashboard).

Data Cleaning

- Removed missing values.
- Fixed data types.
- Removed duplicates.
- Standardized category names.

Key KPIs

- **Avg Price**

  €35.1

- **Avg Rating**

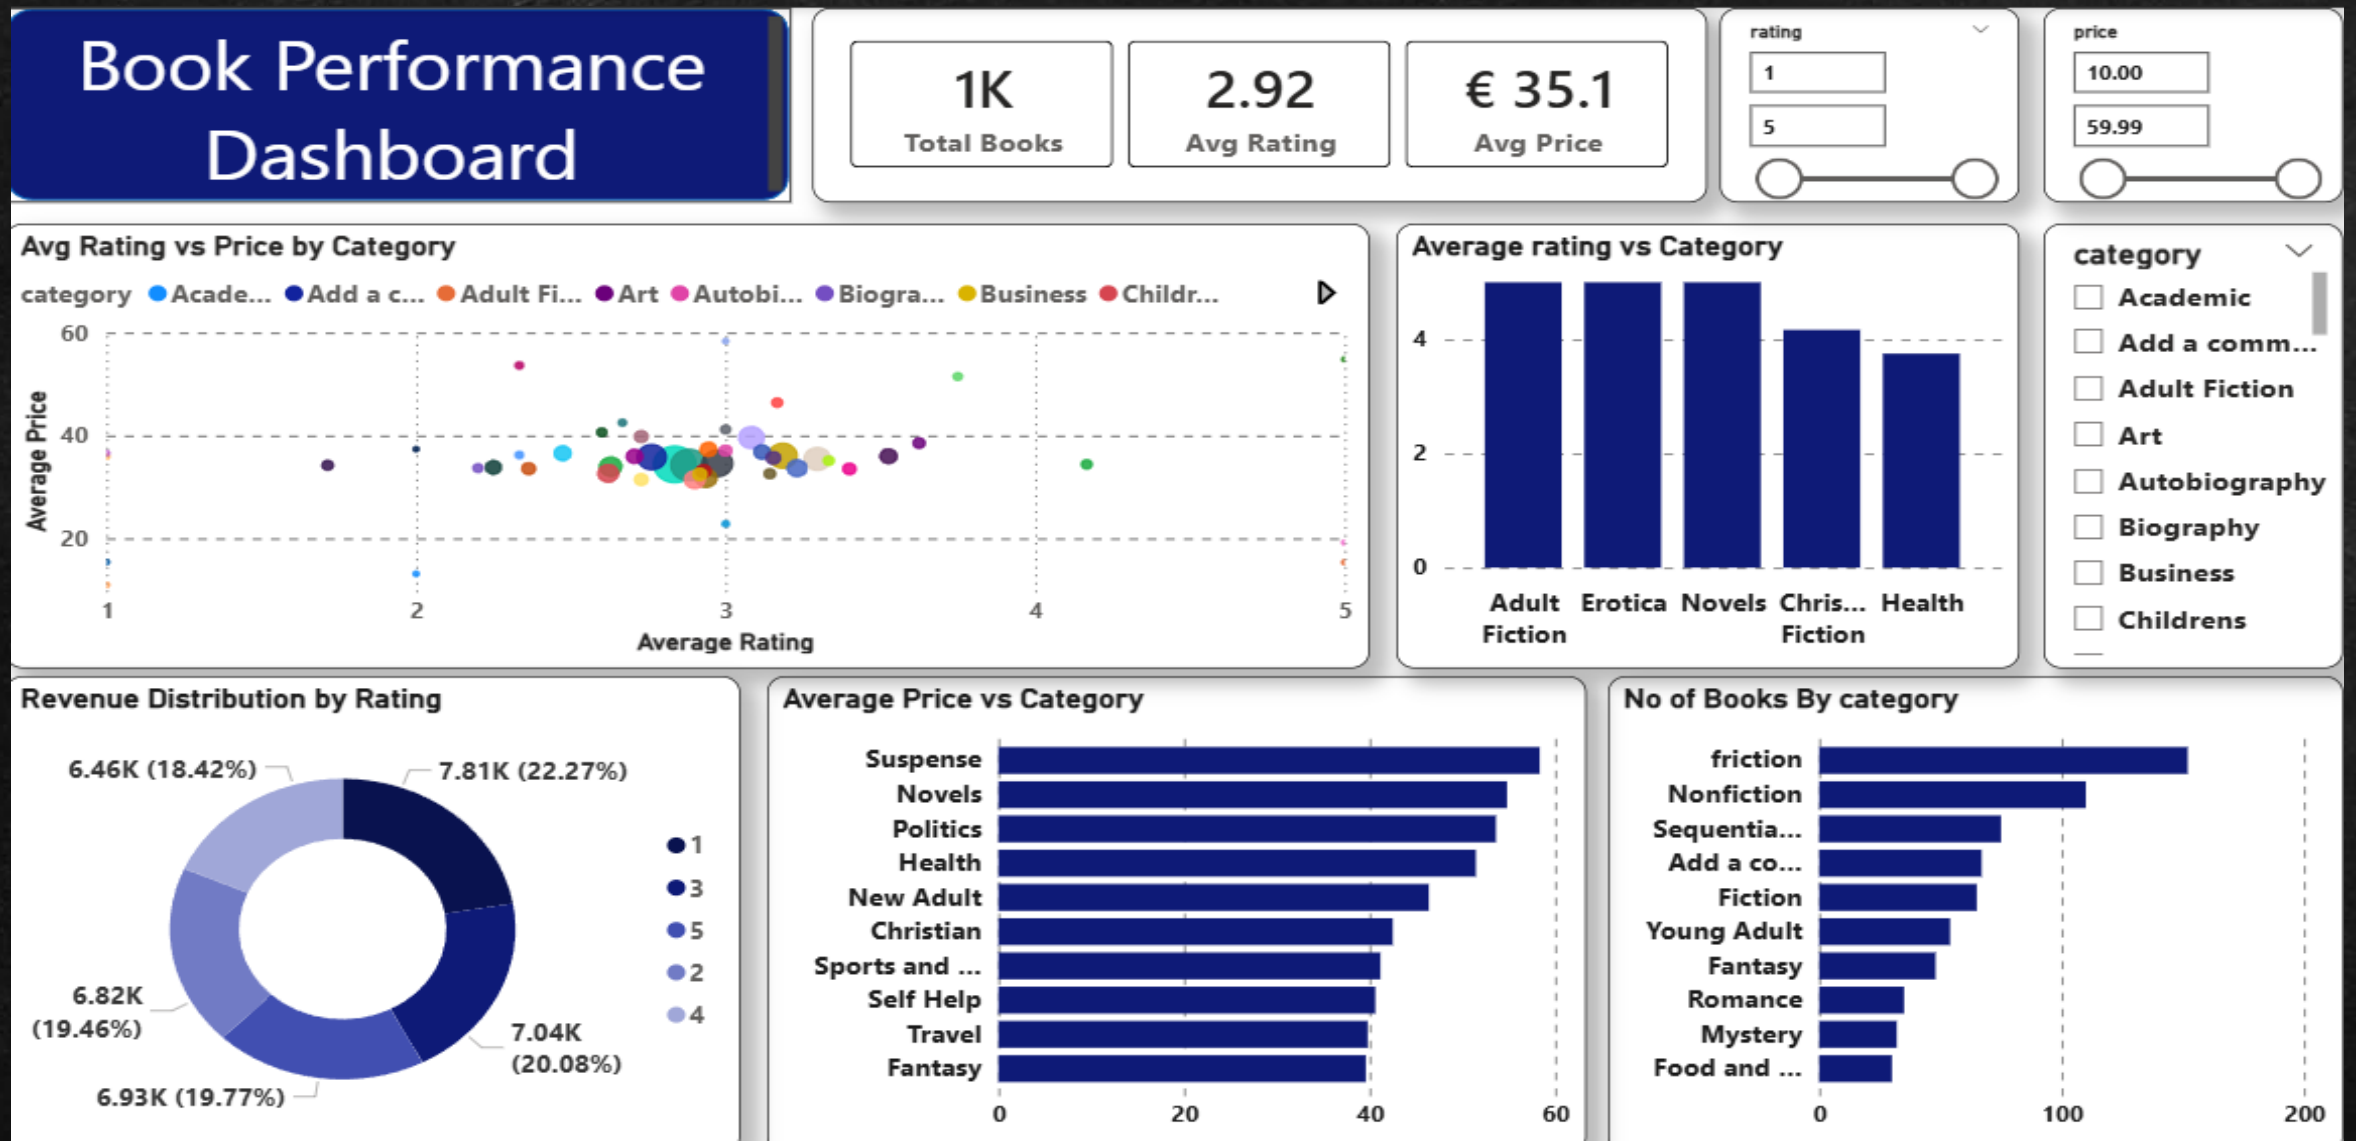
  2.92

- **Total Books**

  1,024

Dashboard Overview

- Interactive dashboard to explore pricing, ratings, and categories.



Insight's

From scatter plot:

- **Most books are clustered around rating 2.5 – 3.5.**
- **No strong relationship between price and rating.**

From category rating chart:

- Categories like **Novels & Erotica** have higher ratings.
- **Health category** has lower ratings.

Insights

From bar chart

- **Some categories have higher average prices.**
- **Pricing varies significantly across categories.**

From “No of Books by Category”

- Fiction category dominates.
- Some categories have very few books.

From donut chart

- **Rating distribution is fairly balanced.**
- **No extreme dominance of a single rating.**

Conclusions

- Price does not strongly impact rating.
- Certain categories perform better in ratings.
- Book distribution is uneven across categories.
